# 1 Introduction

Spam messages have become a major concern in communication systems such as email, SMS, WhatsApp, and social media platforms. These messages often contain fraudulent content, phishing links, advertisements, or malicious attachments. Automated spam detection plays a crucial role in ensuring secure communication.

Machine Learning methods, especially Naive Bayes classifiers, have proven effective for text classification. Recently, quantum computing has introduced new ways to develop hybrid quantum-classical machine learning models. This project compares three approaches:

- Classical Naive Bayes
- Quantum Naive Bayes
- Advanced Quantum Naive Bayes

A Spam Detector Web App was also built using Gradio, enabling users to test messages in real-time.

# 2 Objectives

The project aims to:

- Implement Classical, Quantum, and Advanced Quantum Naive Bayes models.
- Compare their performance using a real-world spam dataset.
- Analyze accuracy, precision, recall, and F1-score.
- Build and deploy a spam detection web application.
- Understand the limitations of quantum models for text classification.

# 3 Dataset Description

The SMS Spam Collection Dataset is used in this project. It contains labeled text messages categorized as “spam” or “ham”.

## Dataset Statistics

- Total messages: 1115
- Ham messages: 966
- Spam messages: 149

## Preprocessing Steps

- Lowercasing text
- Removing stopwords
- Vectorizing text using CountVectorizer
- Splitting into training and testing sets

## 4 Methodology

### 4.1 Preprocessing

Text preprocessing included:

- Converting labels (ham = 0, spam = 1)
- Feature extraction using CountVectorizer (1000 features)
- 80:20 train-test split

### 4.2 Classical Naive Bayes

Implemented using MultinomialNB, known for efficient performance on text data.

### 4.3 Quantum Naive Bayes

This model uses:

- A 4-qubit quantum circuit
- AmplitudeEmbedding
- Rotational layers
- CNOT entanglement
- Hybrid probability mixing (70% classical, 30% quantum)

### 4.4 Advanced Quantum Naive Bayes

This approach includes:

- 3-qubit quantum circuit
- RY and RZ layers with CZ entanglement
- Quantum feature appended to classical features
- GaussianNB used as final classifier

## 5 Experimental Results

### 5.1 Classical Naive Bayes

Accuracy: 0.9839

Classical Naive Bayes Results:				
Accuracy: 0.9839				
	precision	recall	f1-score	support
0	0.99	0.99	0.99	966
1	0.95	0.93	0.94	149
accuracy			0.98	1115
macro avg	0.97	0.96	0.96	1115
weighted avg	0.98	0.98	0.98	1115

### 5.2 Quantum Naive Bayes

Accuracy: 0.8969

Quantum Naive Bayes Results:				
Accuracy: 0.8969				
	precision	recall	f1-score	support
0	0.90	0.99	0.94	966
1	0.89	0.26	0.40	149
accuracy			0.90	1115
macro avg	0.89	0.63	0.67	1115
weighted avg	0.90	0.90	0.87	1115

### 5.3 Advanced Quantum Naive Bayes

Accuracy: 0.1500

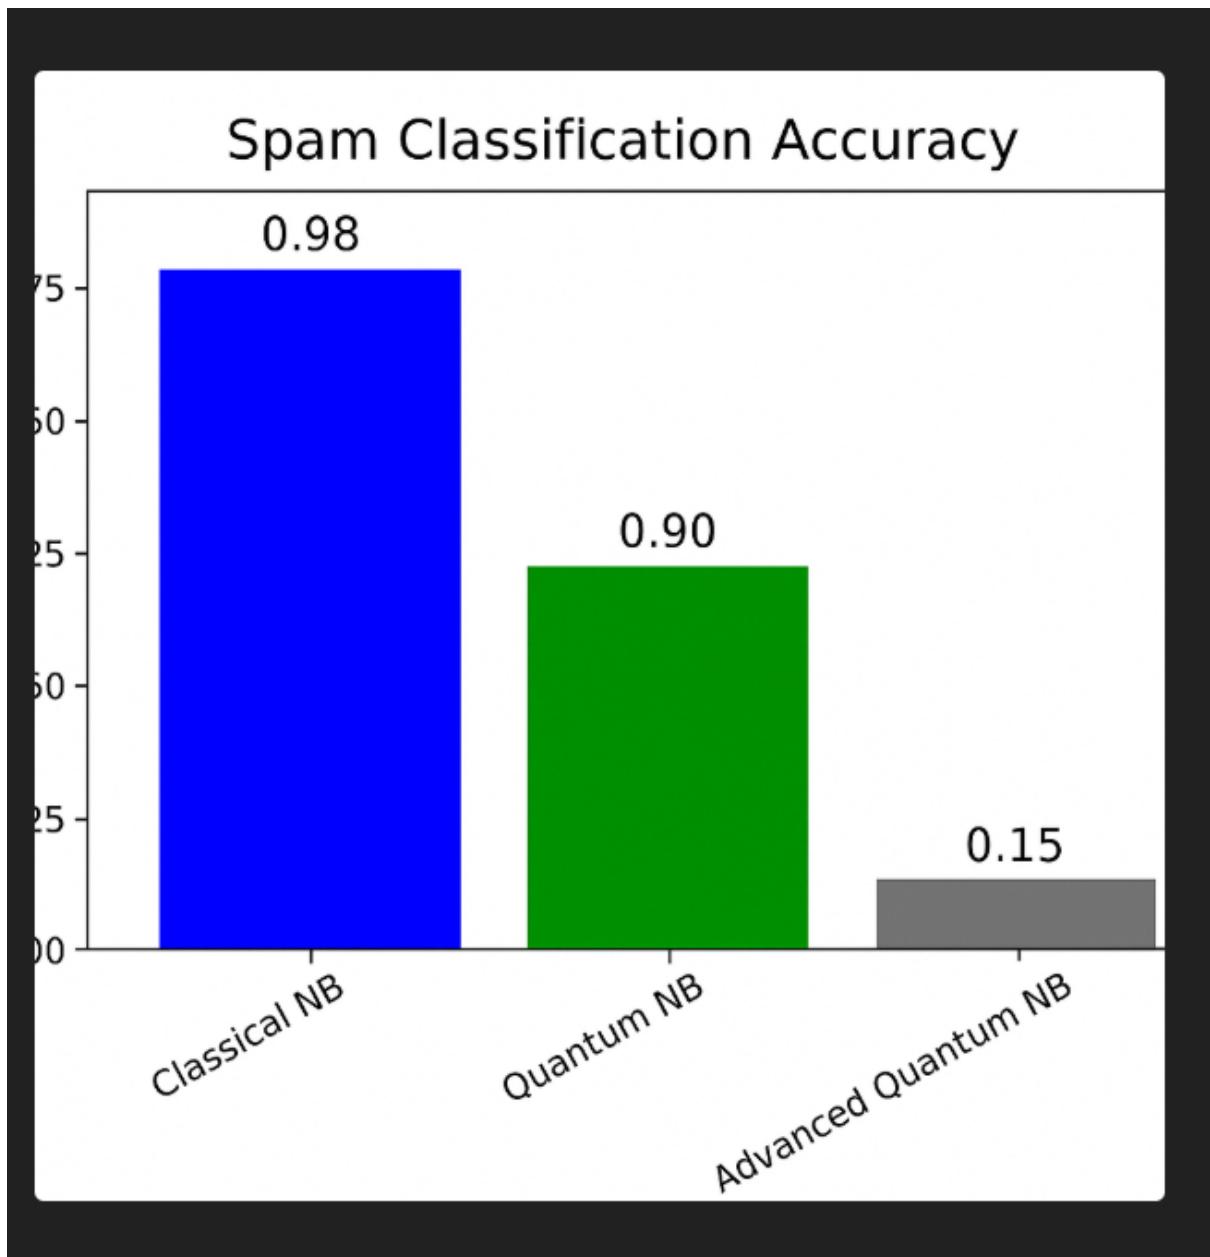

**Advanced Quantum Naive Bayes Results:**

**Accuracy: 0.1500**

	<b>precision</b>	<b>recall</b>	<b>f1-score</b>	<b>support</b>
0	<b>1.00</b>	<b>0.06</b>	<b>0.11</b>	<b>90</b>
1	<b>0.11</b>	<b>1.00</b>	<b>0.19</b>	<b>10</b>
<b>accuracy</b>			<b>0.15</b>	<b>100</b>
<b>macro avg</b>	<b>0.55</b>	<b>0.53</b>	<b>0.15</b>	<b>100</b>
<b>weighted avg</b>	<b>0.91</b>	<b>0.15</b>	<b>0.11</b>	<b>100</b>

## 5.4 Accuracy Comparison

<b>Model</b>	<b>Accuracy</b>
Classical NB	0.9839
Quantum NB	0.8969
Advanced Quantum NB	0.1500

## Advanced NB Output

The screenshot shows a dark-themed user interface for a 'SPAM DETECTOR'. At the top center is the title 'SPAM DETECTOR'. Below it is a subtitle 'Check if a message is SPAM or HAM'. On the left, there's a 'Message' input field containing the text 'Win \$1000 now! Click here!'. Below this is a 'Model' selection section with three radio buttons: 'Classical' (unselected), 'Quantum' (unselected), and 'Advanced' (selected). At the bottom of this section are two buttons: 'Clear' (gray) and 'Submit' (orange). On the right, there's a 'Result' output field showing 'SPAM' and a 'Flag' button below it.

## 7 Discussion

The Classical Naive Bayes model achieved the highest accuracy (98.39%), demonstrating strong compatibility with text-based features.

Quantum Naive Bayes achieved 89.69% accuracy, but struggled to classify spam due to reduced feature dimensions and circuit limitations.

The Advanced Quantum Naive Bayes model performed poorly (15% accuracy) due to:

- Small subset of training samples
- Limited number of qubits
- Information loss in amplitude encoding

Quantum ML is promising, but currently limited for natural language processing tasks.

## 8 Conclusion

This project demonstrates the implementation and comparison of classical and quantum Naive Bayes models for spam detection. The following conclusions were drawn:

- Classical Naive Bayes is the most effective for text classification.
- Quantum models are experimental and need improvements in encoding and circuit design.
- The Spam Detector App successfully integrates all three models.
- Quantum ML is not yet suitable for real-world NLP tasks.

## 9 Future Enhancements

- Implement Quantum SVM and Quantum Neural Networks.
- Use angle embedding for better quantum feature representation.

- Train with larger datasets.
- Deploy the spam detection app online.
- Run quantum circuits on real IBM Quantum hardware.
